

SI 539 Final Project Documentation
Liam Wiesenberger

1. Responsive design choices:
 - a. On the “Creative Work” page with the Grid, if you make the window smaller you see that when the background turns to yellow, the grid changes from 3 to 2 columns! And then when you make it even smaller, the background returns to blue, and there is one grid column, as well as one column for the navigation buttons. This makes it easier to click on the buttons in mobile.
2. Grid:
 - a. Grid can be found on the “Creative Work” and the “Lightbox” pages. Grid is the most logical choice for those pages because Grid can do everything Flexbox can do, and *more*.
3. JavaScript and JQuery:
 - a. On the “Creative Work” page, you can click on any of the goose photos and it will disappear! This is an appropriate use of JQuery because I am afraid of geese, so it tells a nice story about me and demonstrates my skills while also being funny/fun.
 - b. On the landing page, I have a Slick carousel. I used <http://kenwheeler.github.io/slick/> and this automatic carousel serves the purpose of welcoming visitors to the page and reinforcing my name and how fun I am!
4. Each page validates for w3 and aXe. Only the lightbox page has the w3 errors that, as outlined in the Lightbox assignment announcement, we do not need to worry about.
 - a. The Instructor Note stated “The Wave errors are being caused by the next/previous icons on the gallery. It is angry that there are links with no content. You do not need to fix this.”
5. Responsive design outlined in point 1.
6. Visually appealing and nothing is broken, yes.
 - a. Also I fixed my navigation so that now it shows you which page you’re currently on!
7. Extras!
 - a. Lightbox
 - b. Carousel
 - c. I did an early demo!
